MULTIPLE FACTOR ANALYSIS BY L. L. THURSTONE The University of Chicago The two-factor problem of Spearman consists in the analysis of a table of intercorrelations for the discovery of some general factor that is common to all of the variables in the table. Spearman differentiates three types of factors,

Factor loadings are very similar to weights in multiple regression analysis, and they represent the strength of the correlation between the variable and the factor (Kline, 1994). Factor analysis uses matrix algebra when computing its calculations. The basic statistic used in factor analysis is the

A Beginner's Guide to Factor Analysis: Focusing on

Multiple factor analysis (MFA) (J. Pagès 2002) is a multivariate data analysis method for summarizing and visualizing a complex data table in which individuals are described by several sets of variables (quantitative and /or qualitative) structured into groups. It takes into account the contribution of all active groups of variables to define the distance between individuals.

3. Methodologies to estimate multiple factor models There are three different methodologies to estimate factor models: 1. time series analysis, 2. cross-section analysis and 3. statistical factor analysis. Time series analysis is possibly the most intuitive approach for estimating a factor model.

Multiple factor analysis (MFA) is a factorial method devoted to the study of tables in which a group of individuals is described by a set of variables (quantitative and / or qualitative) structured in groups. It may be seen as an extension of:

Factor Analysis [Documentation PDF] Factor Analysis (FA) is an exploratory technique applied to a set of outcome variables that seeks to find the underlying factors (or subsets of variables) from which the observed variables were generated.

AN INTRODUCTION TO MULTIVARIATE STATISTICS

Multiple Factor Analysis (MFA) studies several groups of variables (numerical and/or categorical) defined on the same set of individuals. MFA approaches this kind of data according to many points of view already used in others methods as: factor analysis in which groups of variables are weighted, canonical analysis, Procrustes analysis, STATIS, INDSCAL.

What is Multiple Factor Analysis? Multiple Factor Analysis (MFA) is useful to simultaneously analyze several tables of variables and to obtain results, particularly charts, that allow to study the relationship between the observations, the variables, and the tables.
