The load combinations in Table 3.1 are recommended for use with design specifications based on allowable stress design (ASD) and load and resistance ... should usually not be considered simultaneously with an extreme wind load because they are mutually exclusive on residential sloped roofs. Further, in most areas of the United States, design ...

Chapter 5 - Design of Wood Framing The principal method of design for wood-framed construction has historically been allowable stress design (ASD). This chapter uses the most current version of the ASD method (AF&PA, 1997), although the load resistance factored design method (LRFD) is now available as an alternative (AF&PA, 1996a).

residential sloped roofs. Further, in most areas of the United States, design winds are produced by either hurricanes or thunderstorms; therefore, these wind events and snow are mutually exclusive because they occur at different times of the year.

## Residential Foundation Design Options and Concepts

Most residential and light commercial construction is based on "boxed" design. In boxed design, horizontal diaphragms (e.g., roof and floor systems) work in conjunction with vertical shear walls to support gravity loads, resist lateral loads, and provide structural stability. In

Note: If you're using Home Designer Pro, place a check in the "Build Roof Planes" option at this time. Whenever you want to regenerate the roof planes after making changes to roof directives, it's necessary to place a check in this setting unless you have the Auto Rebuild Roofs setting turned on.

Roof Plans A roof plan is used to show the shape of the roof. Materials such as the roofing material, vents and their location, and the type of underlayment are also typically specified on the roof plan, as seen in Figure 20.3. Roof plans are typically drawn at a scale smaller than the scale used for the floor plan. A scale of 1/ 8" = 1'-0" ...
