Rubber Nanocomposites: Preparation, Properties, and

reinforced rubber nanocomposites have been widely used in various rubber products such as tires, tubes, etc. It is the excellent nano-reinforcing effect of carbon black that greatly upgrades the mechanical properties of rubber, and makes many rubber applications possible. Recently, rubber-clay nanocomposites have

attracted great interests.

permittivity, tracking, and erosion resistance; and the thermal properties: thermal conductivity, thermal degradation, and heat erosion resistance of electrospun nanocomposites are compared to those of conventional nanocomposites for silicone rubber and cycloaliphatic epoxy-based polymers.

A Study of the Material Properties of Silicone

While the preparation of nanocomposites based on nylon-6 matrix has been widely described using the in situ intercalative polymerization (see Section 3.2.1), less attention has been drawn to the nylon-6-based nanocomposites prepared by melt blending.
